## IN THE CLAIMS:

Please cancel Claim 15 without prejudice to or disclaimer of the subject matter presented therein. Please amend Claims 10 to 13 as shown below.

1 to 9. (Cancelled)

10. (Currently Amended) A method of producing a probe medium that contains a probe capable of specifically binding to a target substance, comprising the steps of:

dissolving the probe in a solvent in which the probe is soluble;

separating the probe from the solvent by acting on adding to the solvent a substance for solubilizing the probe in an organic solvent; and

dissolving the probe in the organic solvent by adding the organic solvent to the probe  $_{\mathtt{a}}$ 

wherein the substance for solubilizing the probe is a cationic surfactant.

- 11. (Currently Amended) The method of producing the probe medium according to claim 10, wherein an amount of the substance for solubilizing the probe in the organic solvent is adjusted on a basis of based on a product between a length of the probe and a mole number of the probe.
- (Currently Amended) [[A]] <u>The</u> method of producing the probe medium according to claim 10, wherein an amount of the substance for solubilizing the

probe in the organic solvent is adjusted on a basis of based on an amount of the probe separated from the solvent.

13. (Currently Amended) A method of immobilizing a probe on a substrate, the probe being capable of specifically binding to a target substance, said method comprising the steps of:

preparing a probe medium comprising (i) the probe, (ii) an organic solvent comprising a coupling agent for coupling the probe to the substrate, and (iii) a substance for solubilizing the probe in the organic solvent; and

providing the probe medium on the substrate by spotting,
wherein the coupling agent comprises silane, and
wherein the substance for solubilizing the probe is a cationic surfactant.

14 to 16. (Cancelled)

- 17. (Previously Presented) The method according to claim 13, wherein the probe medium further comprises a solvent in which the probe is soluble.
- 18. (Previously Presented) The method according to claim 13, wherein an amount of the substance for solubilizing the probe in the organic solvent is adjusted within a range in which white turbidity of the probe medium can be observed.
